LangChain Loader Practice: Computer Networks

Topic: Transmission Delay and Propagation Delay

Transmission delay is the time required to push all packet bits onto the communication link. It depends on packet size and transmission rate.

Propagation delay is the time required for a signal to travel from the sender to the receiver. It depends on distance and propagation speed.

Example: A large packet can have a high transmission delay even on a short link. A long-distance link can have a high propagation delay even for a small packet.
